SCD2 — Slowly Changing Dimension Type 2
Each row in the employee dimension represents one version of the employee record. When an employee changes department, gets promoted, or receives a salary adjustment, a new version is created with updated values. The previous version's end date is set and is_current changes to 0.

Why employee_sk instead of emp_id?
emp_id (e.g., E003336) appears on every version of the employee. Joining fact tables on emp_id creates a Many-to-Many relationship — Power BI cannot determine which version to use. employee_sk is unique per version, giving a clean One-to-Many join. Each monthly headcount snapshot captured the correct employee_sk at that point in time, preserving historical accuracy.

Impact: Without SCD2, a department transfer looks like a new hire + termination. With SCD2, it's a version change — headcount stays constant, history is preserved.

Semantic Layer Ownership
Data Engineering owns Bronze and Silver. People Analytics owns Gold, Semantic, and all Power BI reports. When DE changes source tables, only the semantic views are updated — zero dashboard changes required.
